How is Liposuction Done?

Liposuction, also known as lipoplasty, liposculpture and lipo, is the most popular cosmetic procedure in the US. After local or general anesthesia is administered, each liposuction surgery begins with a small incision to allow access to the targeted area. IV fluid is then injected to loosen the fat, and then the surgeon inserts a cannula (small metal, hollow tube) to begin suctioning out the fat. The surgeon sculpts the area to the correct contour through different incision sites.

How Does Coolsculpting™ Work?

Coolsculpting™ is an incredible noninvasive treatment for fat reduction by cryolipolysis (fat freezing). Each treatment will take 35 – 60 minutes and some patients have additional treatments during the same visit. Typically, patients need 1 – 3 separate treatments to achieve the desired results. Coolsculpting™ treatment begins with precise placement of a transparent gel pad to protect the skin and the applicator is set in place. The targeted area is suctioned into a cup and the controlled cooling begins to freeze fat cells. After this step, the practitioner will massage the treated area to break up more fat cells.

La Belle Vie is Excited to Announce Coolsculpting™

Coolsculpting™ treatments safely and effectively reduce stubborn areas of fat with **no surgery and no downtime.** Get your body summer-ready – La Belle Vie offers the **best experience at the best price**, take advantage of our special Coolsculpting™ introductory pricing. **Don't delay, you deserve to have your ideal figure** – [click here](#) or call us at 801-683-0356 to request a consultation.
